## Calculating Density

Density is a physical property of matter. Remember that density tells how much mass is in a given unit of volume. So to calculate the density of an object you must know two things - its mass(g) and its volume (mL). We calculate density by dividing the mass by the volume. That makes the unit for density $\mathrm{g} / \mathrm{mL}$.

The density of water is $1 \mathrm{~g} / \mathrm{mL}$. Any substance that has a density less than $1 \mathrm{~g} / \mathrm{mL}$ will float on water. Any substance that has a density greater than $1 \mathrm{~g} / \mathrm{mL}$ will sink in water.

You can use density to predict whether an object will sink or float in water. The density of a substance is constant (it always stays the same). Density does not depend on the amount of the substance you have.

Materials: 1 can Diet Coke, 1 can Coke, large, clear, container filled with water, triple beam balance, calculator

## What To Do:

1. Your teacher will show you two cans of soda.
2. What differences do you observe?
3. Your teacher will read the volume in mL of each can.
4. Record below - don't forget your units!

Regular Coke volume $\qquad$
Diet Coke volume $\qquad$
5. Your teacher will use the triple beam balance to determine the mass of each soda can.
6. Record below - don't forget your units!

Regular Coke mass $\qquad$ _
Diet Coke mass $\qquad$

$$
\text { Density }=\underline{\text { mass }}
$$

volume

Mass of Regular Coke $=$
Volume of Regular Coke $=$

8. Use your calculator to divide the mass by the volume.

Density of Regular Coke $=$ $\qquad$
9. Repeat for Diet Coke.

Density of Diet Coke = $\qquad$
As we learned at the beginning of the lesson the density of water is $1 \mathrm{~g} / \mathrm{mL}$. Anything that has a density of less than 1 will float in water and anything that has a density of greater than 1 will sink in water. From your calculations and the information give above, predict what will happen when the cans of soda are placed in a container of water.

## Will they sink or float?

The regular Coke will $\qquad$ .
The Diet Coke will $\qquad$

Draw what happens.

Materials: 3 blocks from previous lesson, ruler, electronic balance and triple beam balance

## What To Do:

1. During the last lesson you observed whether or not 3 different blocks would sink or float in water.
2. Record what happened in the chart below.
3. Use the triple beam balance to determine the mass.
(Double-check your mass with the electronic scale)
4. Volume can also be determined by measuring 3
sides of a regular shaped object and multiplying the numbers together. This unit of measurement is $\mathrm{cm}^{3}$.
5. Use the ruler to measure 3 different sides of each block and multiply them together to get the volume.
6. Divide the mass by the volume to get the density.

|  | Block \# 1 | Block \# 2 | Block \# 3 |
| :--- | :--- | :--- | :--- |
| Sinks/Floats |  |  |  |
| Mass (g) |  |  |  |
| Volume $\left(\mathrm{cm}^{3}\right)$ |  |  |  |
| Density <br> $\left(\mathrm{g} / \mathrm{cm}^{3}\right)$ |  |  |  |

## Questions:

1. Did the blocks with greater than $1 \mathrm{~g} / \mathrm{cm}^{3}$ float or sink?
2. Did the blocks with less than $1 \mathrm{~g} / \mathrm{cm}^{3}$ float or sink?
3. Why? $\qquad$ -

## Directions:

1. Calculate the densities for each of the unknown substances in the data table below.

Data for Unknown Substances

| Substance | Mass <br> $(\mathrm{g})$ | Volume <br> $\left(\mathrm{cm}^{3}\right)$ | Density <br> $\left(\mathrm{g} / \mathrm{cm}^{3}\right)$ |
| :---: | :---: | :---: | :---: |
| 1 | 6.95 | 4.0 |  |
| 2 | 4.54 | 2.0 |  |
| 3 | 5.40 | 3.0 |  |
| 4 | 10.35 | 5.0 |  |

2. Compare them with the table of densities of known substances shown below.

## Densities of Some Known Substances

| Substance | Density <br> $\left(\mathrm{g} / \mathrm{cm}^{3}\right)$ |
| :--- | ---: |
| Calcium | 1.54 |
| Carbon | 2.27 |
| Magnesium | 1.74 |
| Phosphorus | 1.82 |
| Platinum | 21.46 |
| Sulfur | 2.07 |

3. Fill in the chart below with the name of the substance according to its density.

| Substance Number | Substance Name |
| :---: | :---: |
| $\mathbf{1}$ |  |
| $\mathbf{2}$ |  |
| $\mathbf{3}$ |  |
| 4 |  |

Name $\qquad$ period $\qquad$

## EXIT TICKET

Calculating Density

1. The mass of 10 mL of baby oil is 9.8 g . Determine the density of baby oil in the space below.
2. The density of water is $\qquad$ .
3. When placed together in a bottle which liquid would be on top? $\qquad$
4. Which liquid would be on bottom? $\qquad$
5. Label the liquids in the bottle.

Conclusion: (less, greater, sank, floated, density, matter)
The physical property $\qquad$ measures how much
$\qquad$ is packed into a volume of space. The metal block $\qquad$ because its density was $\qquad$ than water. The Diet Coke $\qquad$ because its density was
$\qquad$ than water.
